Apex Ridge | Solution brief

1 / What changes for the quarterly workflow

The business need

Analysts currently read lengthy competitor filings and retype figures into a comparison. A PM checks plausibility; compliance must locate every board figure in its original filing. The error risk sits between source interpretation and the populated table. The proposed system makes that step visible and reviewable, while retaining both human approval gates.

What the prototype provides

A local tool discovers SEC filings and gathers supporting passages. An AI reviewer interprets disclosures and explains which figures it selected or withheld; source checks constrain what can enter the comparison. The review screen links each supported value to its source. A formatted Word document travels with the quarterly package. PMs can search SEC registrants, add peers and define new metrics without code. PDF and CSV remain available. A machine-readable audit record preserves decisions, structured portfolio data and scanned-page evidence. The first cycle is Q4 2024 using filings available by February 28, 2025.

What a reviewer sees

A figure appears with its reporting date and evidence status. Unclear or conflicting figures appear as visible review items, not confident guesses. The reviewer sees whether the number has locatable evidence, why the AI selected it and what remains unresolved, then can inspect the original source and record an interpretation. Missing access is distinguished from missing disclosure. The portable report keeps the same qualifications as the review screen; exporting does not erase the caveats.

Choices that improve consistency

Contractual fees are shown separately from disclosed effective fees and temporary waivers. Golub and KREF use investor shareholder returns, while interval funds use the applicable net fund return. KREF remains in the peer group because clients benchmark against it, but its real-estate structure is explicit. Different borrowing and distribution definitions are not presented as automatically equivalent.

Current delivery status

The parser baseline retrieves 167 selected SEC filings and supports 26 current cells and 21 historical observations. An LLM judgment layer now adds evidence interpretation and selection rationales; live model testing has exposed citation-formatting and table-context limitations; unverified decisions remain blank. Source checks cover per-share figures, fee terms, return calculations and rounding differences. Remaining cells need interpretation or further extraction; the package still requires human approval. The supplied Apex Ridge file remains withheld because Dana disputed its provenance. No replacement data is invented to fill these gaps.

Apex Ridge | Solution brief

2 / Rollout, tradeoffs and decisions

First operational run

Review the downloaded filings and check the extracted passages against originals, including fee waivers and differences between investor returns and underlying asset returns. Resolve the authoritative Apex Ridge input with Dana. Then present a populated example to the PM and compliance team; check the Word package and agree what needs attention in review.

Quarterly process

An operator runs the tool for the agreed preparation date. The analyst reviews highlighted exceptions and records interpretations instead of silently retyping figures. The PM reviews the comparison and material differences. Compliance follows the original filing references. Only after those approvals does the package enter board or investor communications. The tool supports this workflow; it does not replace professional judgment.

History and scope

The requested competitor history is eight quarter-end per-share observations. The current approved scope for Apex history would start in Q1 2024 and end in Q4 2024 once source approval is obtained; it will not be padded. Other measures are latest supported values for the cycle. Older competitor periods stay labeled so the board can see reporting lags.

Tradeoffs

The prototype prioritizes defensible evidence and explicit gaps over filling every cell. Complex tables and narrative terms may still require manual confirmation, and no time-saving percentage has been established. A local tool keeps operation simple but requires an operator; it is not yet a hosted, scheduled or authenticated multi-user service. The requested Word output is implemented. Custom metrics require precise definitions and disclosed values; new peers may expose unfamiliar layouts and need more review. No arbitrary custom calculations are promised.

Path to production

Use a complete quarterly cycle to measure source coverage, extraction accuracy and time spent reviewing exceptions. Add rules for recurring fund-specific layouts, then automate scheduling and alerts. Introduce controlled access, signed approvals and retained evidence packages before routine publication. Production readiness requires reliable live retrieval, approved internal data, demonstrated financial accuracy and agreement from the PM and compliance owners.
